

Rough Terrain Forklift

Used Rough Terrain Forklift Santa Rosa - Forklifts rely on two forks to unload, load and transport items. Forklifts fall into two main categories, industrial forklifts and rough terrain forklifts. Ideal for working on surfaces that are level and smooth, industrial forklifts are mostly utilized for warehouse applications and loading dock situations. Ideal for uneven terrain and rocky locations, rough terrain forklifts travel well in difficult environments. Rough terrain forklifts are often seen at construction sites and outdoors. They have the weight capacity, size and tires to handle heavy loads. The main difference between rough terrain and industrial forklifts is the cushion tires that are on industrial forklift models. Rough terrain forklifts, on the other hand, are fitted with pneumatic tires, a type of tractor tire allowing for better traction and flotation properties. Internal combustion engines can power industrial forklifts; however, more often they rely on an electrical source such as a fuel cell or better. Rough terrain models typically rely on an internal combustion engine.

Types of Class 7 Rough Terrain Forklift Trucks There are three main types of Class 7 Rough Terrain Forklift Trucks: 1. Straight mast forklifts; 2. Telehandler forklifts; and 3. Rotating telehandler forklifts.

Rough terrain forklifts function well in treacherous locations that are often found in construction sites and military settings. A rough terrain forklift also offers increased maneuverability and performance. Safety considerations are taken into account for rough terrain locations with raising loads in difficult environments to keep the operator safe from tipping over. For safety reasons, it is vital the forklift maintains stability before moving, lifting or lowering. Adequate stability and proper lifting techniques need to be implemented to keep the forklift stable on the ground.

Straight Mast Forklifts Straight mast forklifts are designed to transport building materials around a range of rough terrain sites such as demolition and construction sites. These forklift trucks provide increased maneuverability and accessibility because it is fitted with big, heavy-duty pneumatic cushion tires. Uneven ground and rough surfaces are no match for pneumatic tires. It is common for straight mast forklifts to come with 2-wheel or 4-wheel drive. Even though these machines are better utilized in exterior locations, many straight mast forklifts operate with propane or diesel, enabling them to be used indoors for short timeframes. Both standard and straight mast forklifts offer similar lifting capacities weighing from 5000 to 36,000 pounds, depending on the model.

Telehandler or Telescopic Handler Forklifts Telehandler or telescopic handler forklift trucks are equipped with a telescoping boom, giving them their name. Telescoping booms are handy for allowing the machine to load and place items at different lift heights and distances in front of the forklift. The reachability of the forklift provides the operator with greater flexibility when placing a load. Standard telehandler forklift units are long and low. They are designed with two wheels located at the front of the forklift with a different pair of wheels found close to the end of the unit. The telescopic boom can be found at the back of the forklift, mounted on a pivot that is attached many feet higher than the frame of the unit. The hydraulic fluid tank and fuel tank are mounted on the opposite side of the cab which is usually situated on the left side of the forklift. Within the frame itself, the transmission and engine are located along the center-line of the forklift. This common configuration allows for a balanced forklift which is necessary for the basic stability of the machine which lifting, transporting and lowering loads. Telehandler units offer significantly higher lifting heights compared to standard units. Also called compact telehandlers or high-reach telehandlers, these forklift trucks can lift their full load capacities from 18 feet, for the compact telehandlers, to 56 feet, for the high-reach telehandlers, into the air. Their load capacities usually range between 5,500 and 12,000 pounds. All-terrain forklifts rely on all-wheel steering to deliver better maneuverability and stability. This, along with power shift transmission and other steering features, means that the operator can move the lift in as close proximity to the work area as possible. Recent telehandler units showcase top-of-the-line ergonomic design to generate increased comfort and operator satisfaction. Spacious cabs and tilted steering are some of the items redesigned for the ultimate comfort and productive features. These ergonomic upgrades have been shown to

lessen repetitive stress injuries and lessen operator fatigue. A single joystick is a common design for most telehandlers. The joystick is responsible for the hydraulic system and the boom operations. Non-marking tires are a feature that telehandler forklifts can benefit from by allowing these units to be utilized for maintenance on billboards and signs and on stadiums and buildings. Rotating Telehandler or Roto Telescopic Handler Forklifts Rotating telehandler or roto telescopic handler forklifts have many features in common with the standard telehandler forklift. The rotating telehandler can lift excessive loads to extreme heights safely and efficiently. This unit's added turntable and rotation flexibility increases the types of jobs it can complete. The rotating function allows the forklift to swivel a full 360 degrees around, enabling access a much larger work area without having to reposition the forklift. Because of this additional feature, rotating telehandlers often have a second joystick to allow operation of the rotation function apart from the lift function. Power-assist steering minimized slip differential on the rear axle for additional traction and four-wheel drive are some of the extra features offered on rotating telehandlers and standard telehandler models. Of course, a machine that can rotate has extra safety considerations to understand. Stabilizers are a rough terrain forklift feature that rotating telehandler models rely on to increase safety while handling rotating loads that are swinging back and forth from each side of the machine. Some rotating telehandlers do not have stabilizers. These units are created to move and work in various aspects of the job site and are easier to reposition without stabilizers. Rotator telehandlers are usually smaller than their fixed cab counterparts, the standard telehandler. Therefore, rotator telehandler units can access smaller loads when compared to standard telehandler units. Rotating telehandlers offer load capacities ranging from 4000 to 10,000 lbs. and lift heights between fifteen to eighty feet. Winch attachments can transform rotator telehandlers and standard models into a crane. These forklift attachments can save time and money by preventing a separate crane rental to be required. Advancements for Rough Terrain Forklifts Many attachments are currently available for rough terrain forklifts, such as booms, winches, rotating fork carriages and articulating booms. Forklift attachments are vital for diversifying the machine. They will continue to be developed for years to come. The majority of advancements will be delivered as safety features built to enhance the rough terrain models. Automatic load restriction units and certain safety features have started being implemented. This system weighs a load automatically and then calculates the safe reach distance of the load while considering the extension and boom angle. An alarm sounds once the safe distance is reached, warning the operator to make load weight, reach distance or boom angle adjustments.
